Head: How now cool cow

Local dairy farmers will be able to see first hand what's being done on a local farm to keep cows cool and reduce the impact of heat stress, with the *Cool Cows field days* coming soon.

Dairy Australia's Dr Steve Little, who developed the *Cool Cows* package says the field days are a great opportunity for farmers to see ideas being put into practice on-farm and to discuss ways to make use of what they already have to keep cows cool this summer.

"Many people are surprised to hear it doesn't take really high temperatures to trigger heat stress in dairy cows. They start to feel uncomfortable once temperatures hit 25 deg C," said Dr Little.

The effects of heat stress include a drop in milk production, reduced herd fertility and lower milk protein and fat tests. It can also trigger live weight losses and create animal health problems.

"The good news is that heat stress can be effectively managed on farm and the benefits are clearly visible," he said.

Some heat stress strategies are simple, quick and cheap to put in place, while others are longer term, involving more cost and effort.

"Providing ways for cows to stay cool will result in substantial benefits in terms of improved productivity and more contented cows. And the *Cool Cows* field days are a great way to get started," said Dr Little.

Farmers wishing to put ideas into action after the field days will be able to draw on the *Cool Cows information package* including the booklet and web-based resources, available on www.coolcows.com.au or www.dairyaustralia.com.au.
